

Color Matching

The Countertop with a Conscience

From the beginning, our core values* have compelled us to make PaperStone® entirely from recycled and natural raw materials. A significant technical challenge has been to make panels that are not as variable in their finished appearance as the natural and recycled raw materials that go into them.

Because phenolic resins 'advance' and begin to darken from the moment they are manufactured, Little Green designs and makes our own proprietary, petroleum-free resins to order for each production run.

State-of-the-art manufacturing processes

We use 100% post-consumer recycled paper that is saturated with natural pigments—not pre-dyed.

Usina piaments rather than dves increases PaperStone's color fastness and resistance to chemicals.

And we employ highly sophisticated, state-of-the-art color measurement and color management technologies along with as much creativity as possible to ensure to the best of our ability that every panel is manufactured to be consistent in color.

Quality management

Every PaperStone® panel leaves Little Green with a barcode that can be used to trace the construction of that panel through every stage of the manufacturing process. If there is ever a problem with a PaperStone® panel, we can trace its construction through the consolidation process, back through the resin saturation process, back through the resin mixing process, back through the resin manufacturing process, all the way back to the paper base roll, the resin mix components and the individual basic resin raw

Despite all of these stringent measures, variations in natural source materials are beyond our ability to control. Because of that, actual product appearance may vary from samples and lot to lot.

PaperStone[®] is an eco-friendly product. Because of variations in natural source materials used to manufacture it, actual product appearance may vary from samples and lot to lot.

† Leather is currently not made with recycled pape
