

IMPORTANT information for PaperStone® processing laboratories

PaperStone® is an ecological material produced using recycled raw materials and natural resins. Like wood finishes, processors have different options when choosing the final appearance of PaperStone®.

PaperStone® panels are delivered with their original finish, a natural surface characterized by typical paper veins. This solution is preferred by many customers.

Sanding the surface is another possibility. This removes the superficial striping, gives the material a “softer” touch and a cloudier color in respect to a non-sanded surface.

SAND WITH CARE WHEN REFINISHING PANELS IN SIENNA COLOR

Sienna is from the range of darker colors called “Solid Colors”.

Attention: if the surface is sanded “aggressively” it will produce particularly light areas.

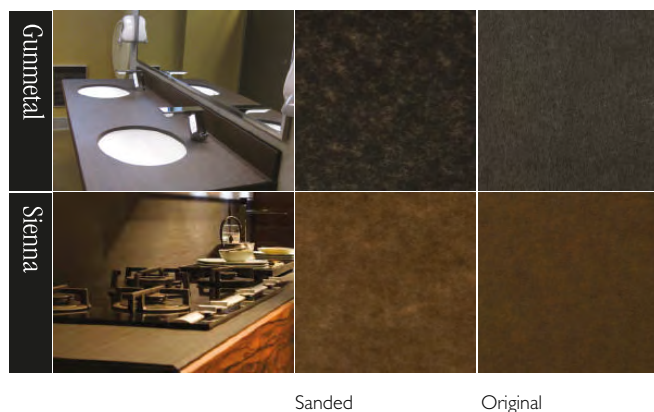

This change in color deriving from excessive sanding is more visible in the perimeter of the panel near the edges or in the joint between 2 panels.

In both cases attention is recommended.

SANDING ANY PAPERSTONE® COLOR MAKES MOTTLING MORE APPARENT.

**HOWEVER, IT IS ESPECIALLY NOTICEABLE WITH
GUNMETAL AND SIENNA.**

When PaperStone® panels are sanded, it is recommended to pay careful attention in the waxing stage, making sure that all the panels are treated equally.

Pay close attention when sanding “Sienna” color panels. Changes in the superficial color cannot be corrected.
